## Uses of Adderall

Adderall is a prescription medication that is commonly used to treat attention deficit hyperactivity disorder (ADHD) in both children and adults. It contains a combination of amphetamine and dextroamphetamine, which are stimulants that work by affecting chemicals in the brain and nerves that contribute to hyperactivity and impulse control. Adderall helps improve focus, concentration, and overall productivity in individuals with ADHD.

In addition to treating ADHD, Adderall is also prescribed to individuals with narcolepsy, a sleep disorder that causes excessive daytime sleepiness and sudden bouts of uncontrollable sleep.

Adderall can help individuals with narcolepsy stay awake and alert throughout the day, improving their quality of life and reducing the risk of accidents due to sleepiness.
