

Buying OxyContin (extended-release oxycodone) online during flash sales from unverified sources carries extreme health dangers and legal risks. The U.S. Drug Enforcement Administration (DEA) has warned about illegal online pharmacies shipping counterfeit pills made with fentanyl or methamphetamine to customers who believe they are receiving genuine OxyContin. These counterfeit pills are indistinguishable from real ones but can cause fatal overdoses. Many of these illegal websites use deceptive identities, fake U.S. addresses, and professional appearances to mislead consumers into thinking they are legitimate pharmacies.

The FDA and CDC alert consumers that such illegal online pharmacies often sell unapproved, counterfeit, or unsafe medications without requiring prescriptions or providing medical guidance. Counterfeit opioids contribute heavily to overdose deaths and public health crises. Warning signs of unsafe online pharmacies include no prescription requirement, prices too low to be true, lack of a licensed U.S. pharmacist, and suspicious packaging. Patients should obtain OxyContin only through licensed healthcare providers and pharmacies to ensure medication authenticity, safety, and proper use.

Misuse or use of counterfeit OxyContin poses serious risks including respiratory depression, addiction, overdose, and death. Legitimate pharmacies verify prescriptions and provide necessary counseling to prevent harm. In summary, the safest way to

obtain OxyContin is through licensed medical channels, avoiding all suspicious online flash sales to protect health and well-being.

If you suspect counterfeit medication from an online source, do not use it and consult a healthcare professional immediately.
