

Buying oxymorphone online during flash sales from unverified sources is extremely dangerous and illegal. The U.S. Drug Enforcement Administration (DEA) warns of a surge in illegal online pharmacies selling counterfeit opioids, including oxymorphone, often laced with deadly substances like fentanyl and methamphetamine. These counterfeit pills look identical to genuine medications but have caused numerous overdoses and deaths.

Oxymorphone is a powerful opioid with serious risks, including life-threatening respiratory depression, addiction, and overdose. It requires strict medical supervision and a valid prescription dispensed through licensed pharmacies. Counterfeit or substandard oxymorphone obtained online can be ineffective, contaminated, or dangerously potent, leading to fatal consequences. Patients should only use oxymorphone prescribed by licensed providers and acquired from trusted, licensed pharmacies.

Warning signs of unsafe online pharmacies include no prescription requirements, prices that seem too good to be true, no U.S. pharmacy license, and suspicious packaging. The FDA advises against purchasing opioids from unverified online sources and recommends consulting healthcare professionals for safe treatment.

In summary, while flash sales for oxymorphone may appear convenient, the only safe and legal way to obtain it is through licensed healthcare channels and pharmacies to ensure authenticity, safety, and avoid serious harm
