## What Is Tramadol?

Tramadol is an opioid-analgesic medication that works on the central nervous system to reduce pain signals. Doctors prescribe it for conditions like chronic pain, post-surgery pain, injury-related pain, and nerve-related pain disorders.

---

## How Tramadol Works

Tramadol acts on brain receptors to change how your body senses pain. It increases serotonin and norepinephrine levels, helping control the pain response and improving comfort levels. Because of its opioid-like effects, medical supervision is required.

---

## Medical Uses of Tramadol

- Post-operative pain relief
- Chronic back or joint pain
- Neuropathic pain

- Muscle or injury-based pain
- Pain associated with arthritis and fibromyalgia

Always use Tramadol as prescribed by a healthcare professional.
