What Is Phentermine?

Phentermine is a prescription appetite suppressant commonly used as a short-term treatment for obesity. It is typically prescribed to adults with a body mass index (BMI) of 30 or higher, or 27 or higher with weight-related conditions such as high blood pressure or type 2 diabetes.

Phentermine belongs to a class of drugs called sympathomimetic amines, which affect the central nervous system to help reduce appetite.

How Phentermine Works for Weight Loss

Phentermine works primarily by suppressing appetite and increasing feelings of fullness. It stimulates the release of certain neurotransmitters in the brain, including norepinephrine, which helps:
