Medicines Uses

Adderall is a commonly prescribed medication for the treatment of attention deficit hyperactivity disorder (ADHD) and narcolepsy. It works by increasing the levels of certain chemicals in the brain that help with focus, concentration, and alertness. People with ADHD often have trouble staying focused and controlling their impulses, and Adderall can help them manage these symptoms effectively.

For individuals with narcolepsy, a condition characterized by excessive daytime sleepiness and sudden bouts of sleep, Adderall can improve wakefulness and reduce the frequency of sudden sleep attacks. By stimulating the central nervous system, Adderall can help narcoleptics stay alert and awake throughout the day.
