Methadone is safe to use during pregnancy and for breastfeeding mothers, and it does not cause any side effects on the health of the baby.

However, comprehensive methadone maintenance treatment should include parental care to prevent any difficulty and complications during pregnancy and childbirth.

Pregnant women who experience withdrawal symptoms are at higher risk of experiencing miscarriage or premature birth of the baby because of uterus contraction caused by withdrawal symptoms.

How To Use Methadone

Methadone is initially used in the treatment of opioid use disorder (OUD) and for [pain management](#). These medications are indicated only to be used on a doctor's prescription.

The active ingredients of this medication remain in the body for a longer time even after the effects of Methadone have worn off, and using any other medicines, which may be opioid or non-opioid, can cause serious drug interactions, which may result in serious health conditions.

Patients who are taking Methadone should use this medication under the supervision of a doctor or practitioner.

Methadone is one component used as part of a comprehensive treatment plan. It includes counseling and therapies for other behavioral health problems to provide patients with a whole-person approach to this treatment.

Methadone is also available in a liquid form that is injected into the body via injection. When used in the treatment of narcotic addiction, Methadone helps to suppress withdrawal symptoms for 24 to 36 hours.

What Is Methadone Dosage

The dose and the length of time a person receives methadone treatment varies from person to person according to their age, sex, health conditions, and based on their opioid medicine dependency. One should use this medication with a doctor's prescription for safe and effective use.

Some methadone tablets are meant to be swallowed at once, while others are meant to be dissolved first in liquid. Methadone is available as a ready-to-drink solution and as a concentrated form, which must be mixed with water or fruit juice and then consumed.

For Adults With (OUD) –

- For adults the initial dose should be 20 – 30 mg tablets to be taken once a day. Your doctor may later adjust your dose according to the response of the medicine. The dose should not exceed more than 40 mg in a day.

For Children –

- Children should not use this medication without a doctor's proper consultation.

Do not change the dose of your medication by yourself. Stick to your prescription unless your doctor tells you to do so. Keep this medication out of reach of children, as it can be harmful to their health.

What Precautions Should I Take

To prevent any side effects, interactions, and withdrawal symptoms, you must consult and ask a doctor about the side effects, potential risks, misuse, and benefits of using a medication before using it.

- Avoid overdosing on these medications, as they can slow or stop your breathing, and it may sometimes lead to death.
- Do not use Alcohol or any other substance while using this medication to prevent it from causing any severe withdrawal symptoms.
- Do not use any other medicines, even after the effects of Methadone have worn off, to prevent the risks of drug interaction.
- Avoid performing any activity that requires your focus and attention, such as driving or using machinery.
- Eat dietary fibers, and drink enough water to prevent constipation.
