## 2. Understanding Oxycodone and Its Purpose

Oxycodone is used to treat **moderate to severe pain** that may arise from injury, surgery, or respiratory discomfort. It works by altering how the nervous system perceives and responds to pain signals. Available in multiple strengths — **5mg, 10mg, 15mg, 20mg, and 30mg** — it offers flexibility for different pain levels under professional supervision.

Oxycodone not only supports pain relief but also promotes relaxation and improved breathing patterns, making it a vital medication for patients with pulmonary challenges or muscle tension linked to respiratory discomfort.
